

## Xanadoo - Cisco

Xanadoo Wireless High-Speed Internet is one of the fastest-growing wireless broadband operators in the U.S. Launched in early 2006, Xanadoo offers service in a number of Texas, Oklahoma and Illinois markets. Additionally, Xanadoo has licensed spectrum holdings in the 2.5MHz frequency bands covering almost 10 million people across 11 states to support planned growth and expansion.

Xanadoo's wireless networks and portable modems are built using the latest Mobile WiMAX technology and equipment from Cisco, the global leader in portable, plug-and-play wireless broadband solutions with over 30 commercial networks currently deployed across 6 continents. Xanadoo is also the first North American WiMAX operator to earn acceptance into the Cisco Powered Partner Program, using an end-to-end Cisco WiMAX access and core services network.

Xanadoo has quickly developed a reputation for offering more affordable and flexible broadband solutions compared to traditional wire line services such as DSL and cable. With features like no phone line or cable service requirements, instant setup, everyday low pricing as low as \$14.95, and 8 speed plans to choose from, Xanadoo offers high-speed Internet the way people want it.

With Mobile WiMAX, high-speed Internet access in the college towns served by Xanadoo has never been easier or more flexible. Both wireless modem options – the “Zero-Install” Desktop Modem and “Internet-On-The-Go” Laptop Card – offer the ability to stay connected anywhere - at home, at work, down the street, even across town.

But the convenience doesn't end there. All Xanadoo wireless modems provide instant plug-n-play set-up with no confusing wires or software to deal with. Xanadoo is driving WiMAX into America's heartland.
